

**Amendments to the Claims**

This listing of claims will replace all prior versions, and listings, of claims in the application:

Listing of Claims:

Claim 1 (Cancelled).

2. (Previously Presented) The method of claim 6, wherein the marker that reflects the activity of osteoblasts is:

(1) a marker associated with the phase of osteoblast proliferation and matrix formation and a marker associated with the phase of calcification; or

(2) a marker associated with the phase of matrix maturation and a marker associated with the phase of calcification.

3. (Previously Presented) The method according to claim 6, wherein the marker that reflects the activity of osteoblasts is:

1) Carboxyterminal propeptide of type I procollagen or Amino terminal propeptide of type I procollagen and osteocalcin; or

2) Bone specific alkaliphosphatase and osteocalcin.

4. (Previously Presented) The method according to claim 6, wherein the marker that reflects the activity of osteoclasts is a marker associated with bone type I collagen.

5. (Previously Presented) The method according to claim 6, wherein the marker that reflects the activity of osteoclasts is deoxypyridinoline and/or Carboxyterminal telopeptide of type I collagen.

6. (Currently Amended) In a method of diagnosing amelioration and/or exacerbation of metastasis of malignant tumor to bone in a patient with a cancer disease,

using markers for bone formation that reflect the activity of osteoblasts and markers that reflect the activity of osteoclasts,

1) wherein the markers that reflect the activity of osteoblasts are

a) a marker associated with the phase of calcification, and

b) a marker associated with the phase of osteoblasts proliferation and/or matrix formation,

2) wherein the marker that reflects the activity of osteoclasts is a marker associated with osteoclasts targeted to evaluation of worsening of the disease,

comprising testing blood from said patient for a  
marker of bone metabolism,

wherein the amelioration of bone metastasis or  
therapeutic effect and the degree of the exacerbation of bone  
metastasis are diagnosed by monitoring said markers,

the improvement wherein said testing comprises  
measuring for bone formation by measuring both (1) osteocalcin  
and (2) at least one marker selected from the group consisting  
of BALP, PICP and PINP, and

measuring bone resorption by as well as measuring  
for ICTP,

determining a Z value for each of said osteocalcin  
and said marker, each said Z value being determined by  
dividing the difference between said measured value for said  
patient and an average value for patients without bone  
metastasis, by a standard deviation of a patient without bone  
metastasis, and determining a crossover index by dividing said  
Z value for osteocalcin by said Z value for BALP, PICP or  
PINP,

determining ICTP level,

assessing amelioration and/or exacerbation of  
metastasis in comparison with existing control data for CR,  
PD, IMP and/or NC,

diagnosing amelioration and/or exacerbation based on  
the value of said crossover index,

said crossover index and said ICTP level providing a  
diagnosis of progression of bone metastasis in the treatment  
of said patient for said cancer.

Claim 7 (Cancelled).

8. (Currently Amended) In a method of evaluating  
the efficacy of drugs for treatment of a cancer disease,

using a formative marker that reflects the activity  
of osteoblasts\_or a marker that reflects the activity of  
osteoclasts,

1) wherein the markers that reflect the activity of  
osteoblasts are

a) a marker associated with the phase of  
calcification, and

b) a marker associated with the phase of  
osteoblasts proliferation and/or matrix formation,

2) wherein the marker that reflects the activity of  
osteoclasts is a marker associated with osteoclasts targeted  
to evaluation of worsening of the disease,

comprising testing blood from a patient for a  
marker of bone metabolism,

wherein the amelioration of bone metastasis or therapeutic effect and the degree of the exacerbation of bone metastasis are diagnosed correctly by monitoring said markers

the improvement wherein said testing comprises measuring for both (1) osteocalcin and (2) one marker selected from the group consisting of BALP, PICP and PINP, and  
as well as measuring bone resorption by measuring  
for ICTP,

determining a Z value for each of said osteocalcin and said marker , each said Z value being determined by dividing the difference between said measured value for said patient and an average value for patients without bone metastasis, by a standard deviation of a patient without bone metastasis, and determining a crossover index by dividing said Z value for osteocalcin by said Z value for BALP, PICP or PINP,

determining ICTP level,

assessing amelioration and/or exacerbation of metastasis in comparison with existing control data for CR, PD, IMP and/or NC,

diagnosing amelioration and/or exacerbation based on the value of said crossover index,

said crossover index and said ICTP level providing a diagnosis of progression of bone metastasis and evaluation of

drug efficacy in the treatment of said patient for said cancer.

9. (Previously Presented) The method according to claim 8, wherein the drug evaluated is a cancer control therapeutic agent.

10. (Previously Presented) The method according to claim 8, wherein the drug evaluated is a bone resorption suppressant.

11. (Previously Presented) The method according to claim 8, wherein the drug evaluated is an endocrine therapeutic agent.

12. (Previously Presented) The method according to claim 8, wherein the marker that reflects the activity of osteoblasts is:

(1) a marker associated with the phase of osteoblast proliferation and matrix formation and a marker associated with the phase of calcification; or

(2) a marker associated with the phase of matrix maturation and a marker associated with the phase of calcification.

13. (Previously Presented) The method according to claim 8, wherein the marker that reflects the activity of osteoblasts is:

(1) Carboxyterminal propeptide of type I procollagen or Amino terminal propeptide of type I procollagen and osteocalcin; or

(2) Bone specific alkaliphosphatase and osteocalcin.

14. (Previously Presented) The method according to claim 8, wherein the marker that reflects the activity of osteoclasts is a marker associated with bone type I collagen.

15. (Previously Presented) The method according to claim 8, wherein the marker that reflects the activity of osteoclasts is deoxypyridinoline and/or Carboxyterminal telopeptide of type I collagen.

Claims 16-24 (Cancelled).

25. (Previously Presented) The method according to claim 6 or 8, wherein said cancer disease is prostate cancer.

26. (Previously Presented) The method according to claim 6 or 8, wherein said cancer disease is breast cancer.

27. (Previously Presented) The method according to claim 8, wherein the drug evaluated is a cancer control therapeutic agent.

28. (Previously Presented) The method according to claim 8, wherein the drug evaluated is a bone resorption suppressant.

29. (Previously Presented) The method according to claim 8, wherein the drug evaluated is an endocrine therapeutic agent.

30. (Currently Amended) In a method of evaluating the efficacy of a drug for the treatment of cancer or for the inhibition or amelioration of a metastasis of said cancer to bone in a patient with cancer, wherein said cancer is selected from the group consisting of prostate cancer and breast cancer,

the improvement wherein said testing comprises measuring for both (1) osteocalcin and (2) one marker selected from the group consisting of BALP, PICP and PINP,

determining a Z value for each of said osteocalcin and said BALP, PICP or PINP, each said Z value being determined by dividing the difference between said measured value for said patient and an average value for patients without bone metastasis, by a standard deviation of a patient

without bone metastasis, and determining a crossover index by dividing said Z value for osteocalcin by said Z value for BALP, PICP or PINP,

said crossover index providing a diagnosis of progression of bone metastasis and evaluation of drug efficacy in the treatment of said patient for said cancer;

wherein assessing or judging amelioration and/or exacerbation of metastasis with regard to the Z value is carried out in comparison with data for CR, PD, IMP and/or NC.

Claim 31 (Cancelled).

32. (New) In a method of evaluating the efficacy of a drug for the treatment of cancer or the inhibition or amelioration of a metastasis of said cancer to bone in a patient with cancer, wherein said cancer is prostate cancer or breast cancer,

the improvement wherein said evaluation comprises testing serum of said patient for a marker of bone formation,

testing said serum for a marker of bone resorption, said marker for bone resorption comprising ICTP,

expressing the measured values in terms of average and standard error,

analyzing variants (ANOVA) according to the Bonferroni method,

Appln. No. 09,763,370

Amd. dated August 17, 2006

Reply to Office Action of August 8, 2006

whereby ICTP values over time demonstrate  
progression of disease.
